

Using agent-based modeling to understand HIV transmission, care, and prevention

Edinah Mudimu, Ph.D.
Senior Lecturer
Decision Sciences
University of South Africa

Outline

- **Introduction** – why mathematical modelling in epidemics
- **Overview of EMOD**
- **Overview of STI-HIV model in EMOD**
- **Results:**
 - Role of voluntary male medical circumcision (VMMC) in reducing HIV incidence and ensuring a sustainable response
 - PrEP
- **Conclusions**

Introduction – why mathematical modelling in epidemics

Understand health care system

Number on treatment by demographic
Suppression rates, fate of those LTFU

Impact on survival and transmission

Cohort studies of survival, suppression
Transmission studies controlling for suppression

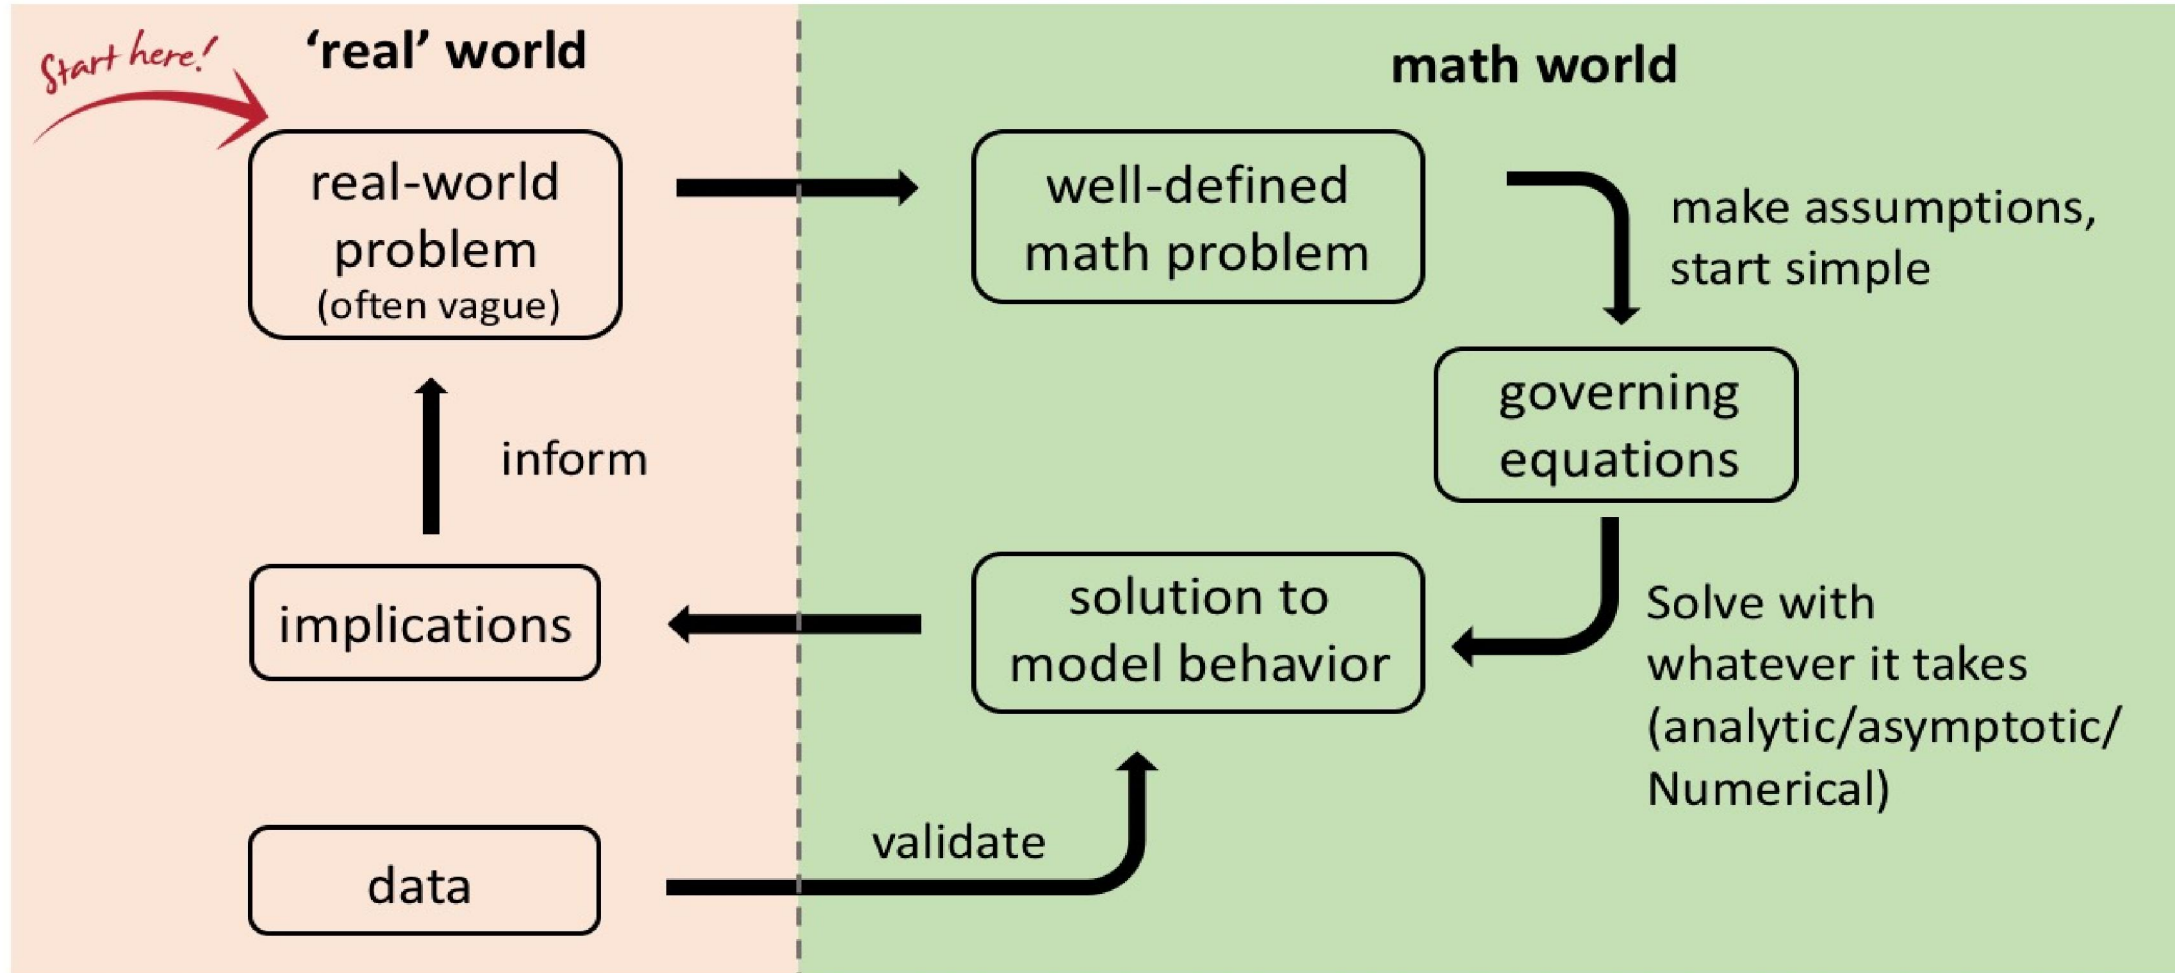

Measured incidence patterns

Challenges of new assays
Biases from sampling, consent

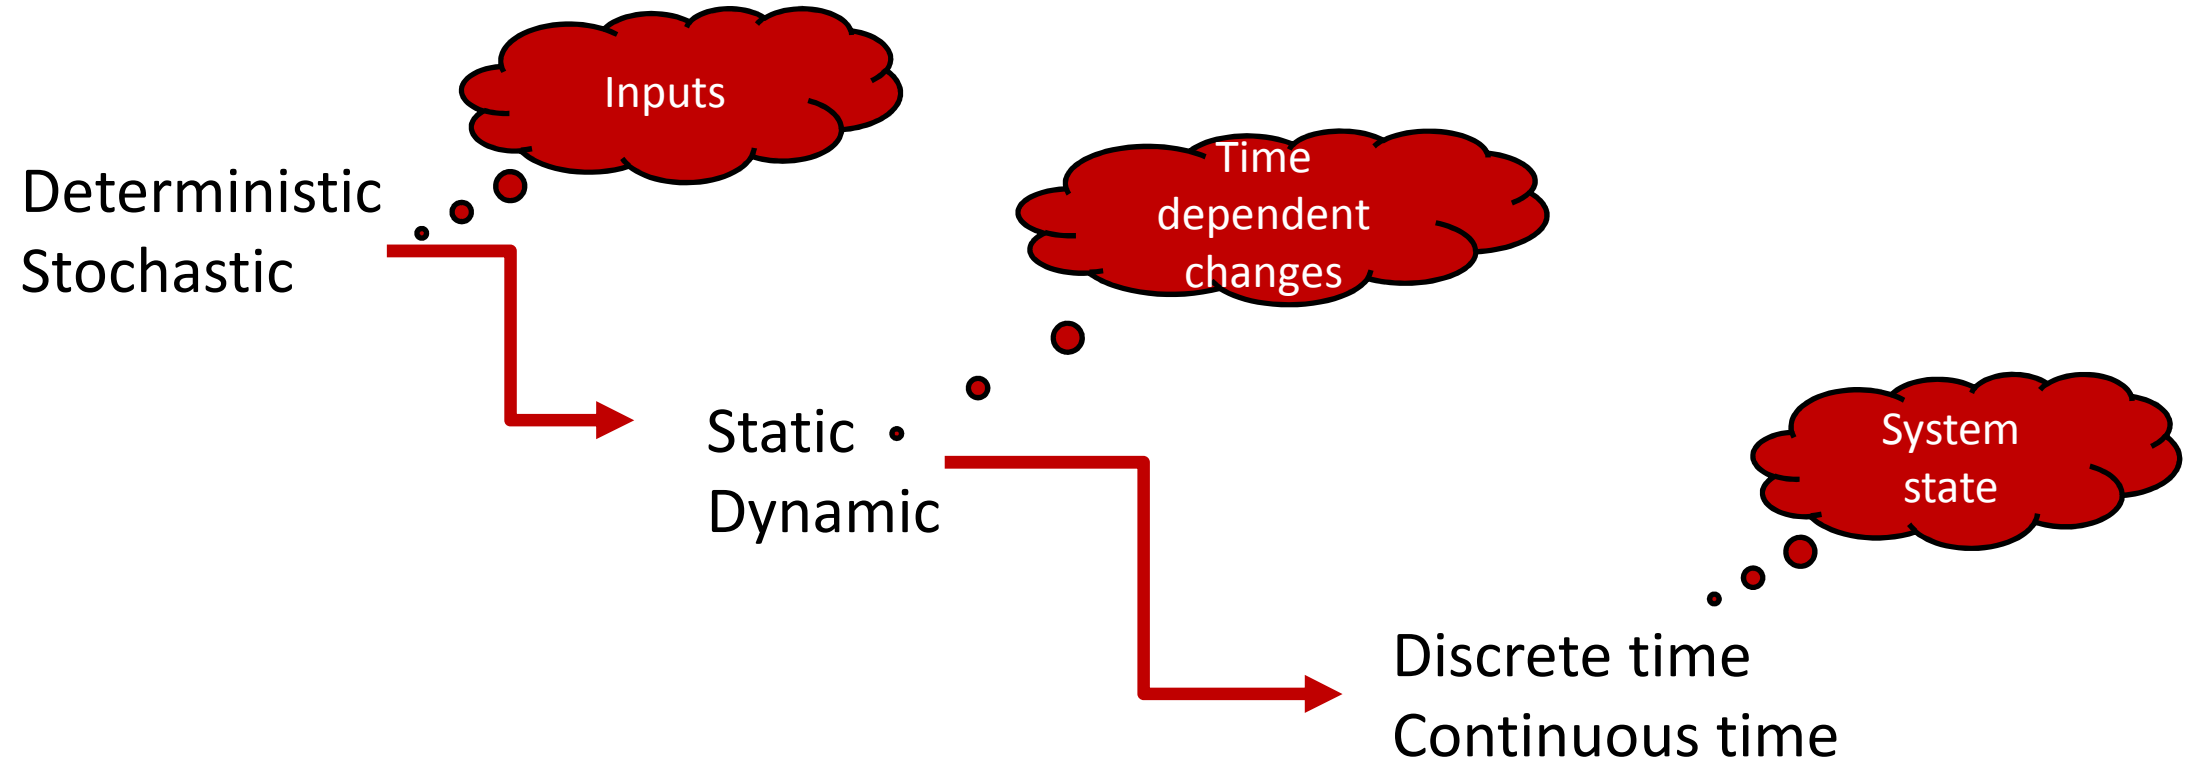

Measured mortality

Challenges of assigning cause of death as conditions change

Typical mathematical modeling process

Mathematical Models

- Mathematical models are further classified into compartmental or agent-based models.

EMOD: Institute for Disease Modeling (IDM)

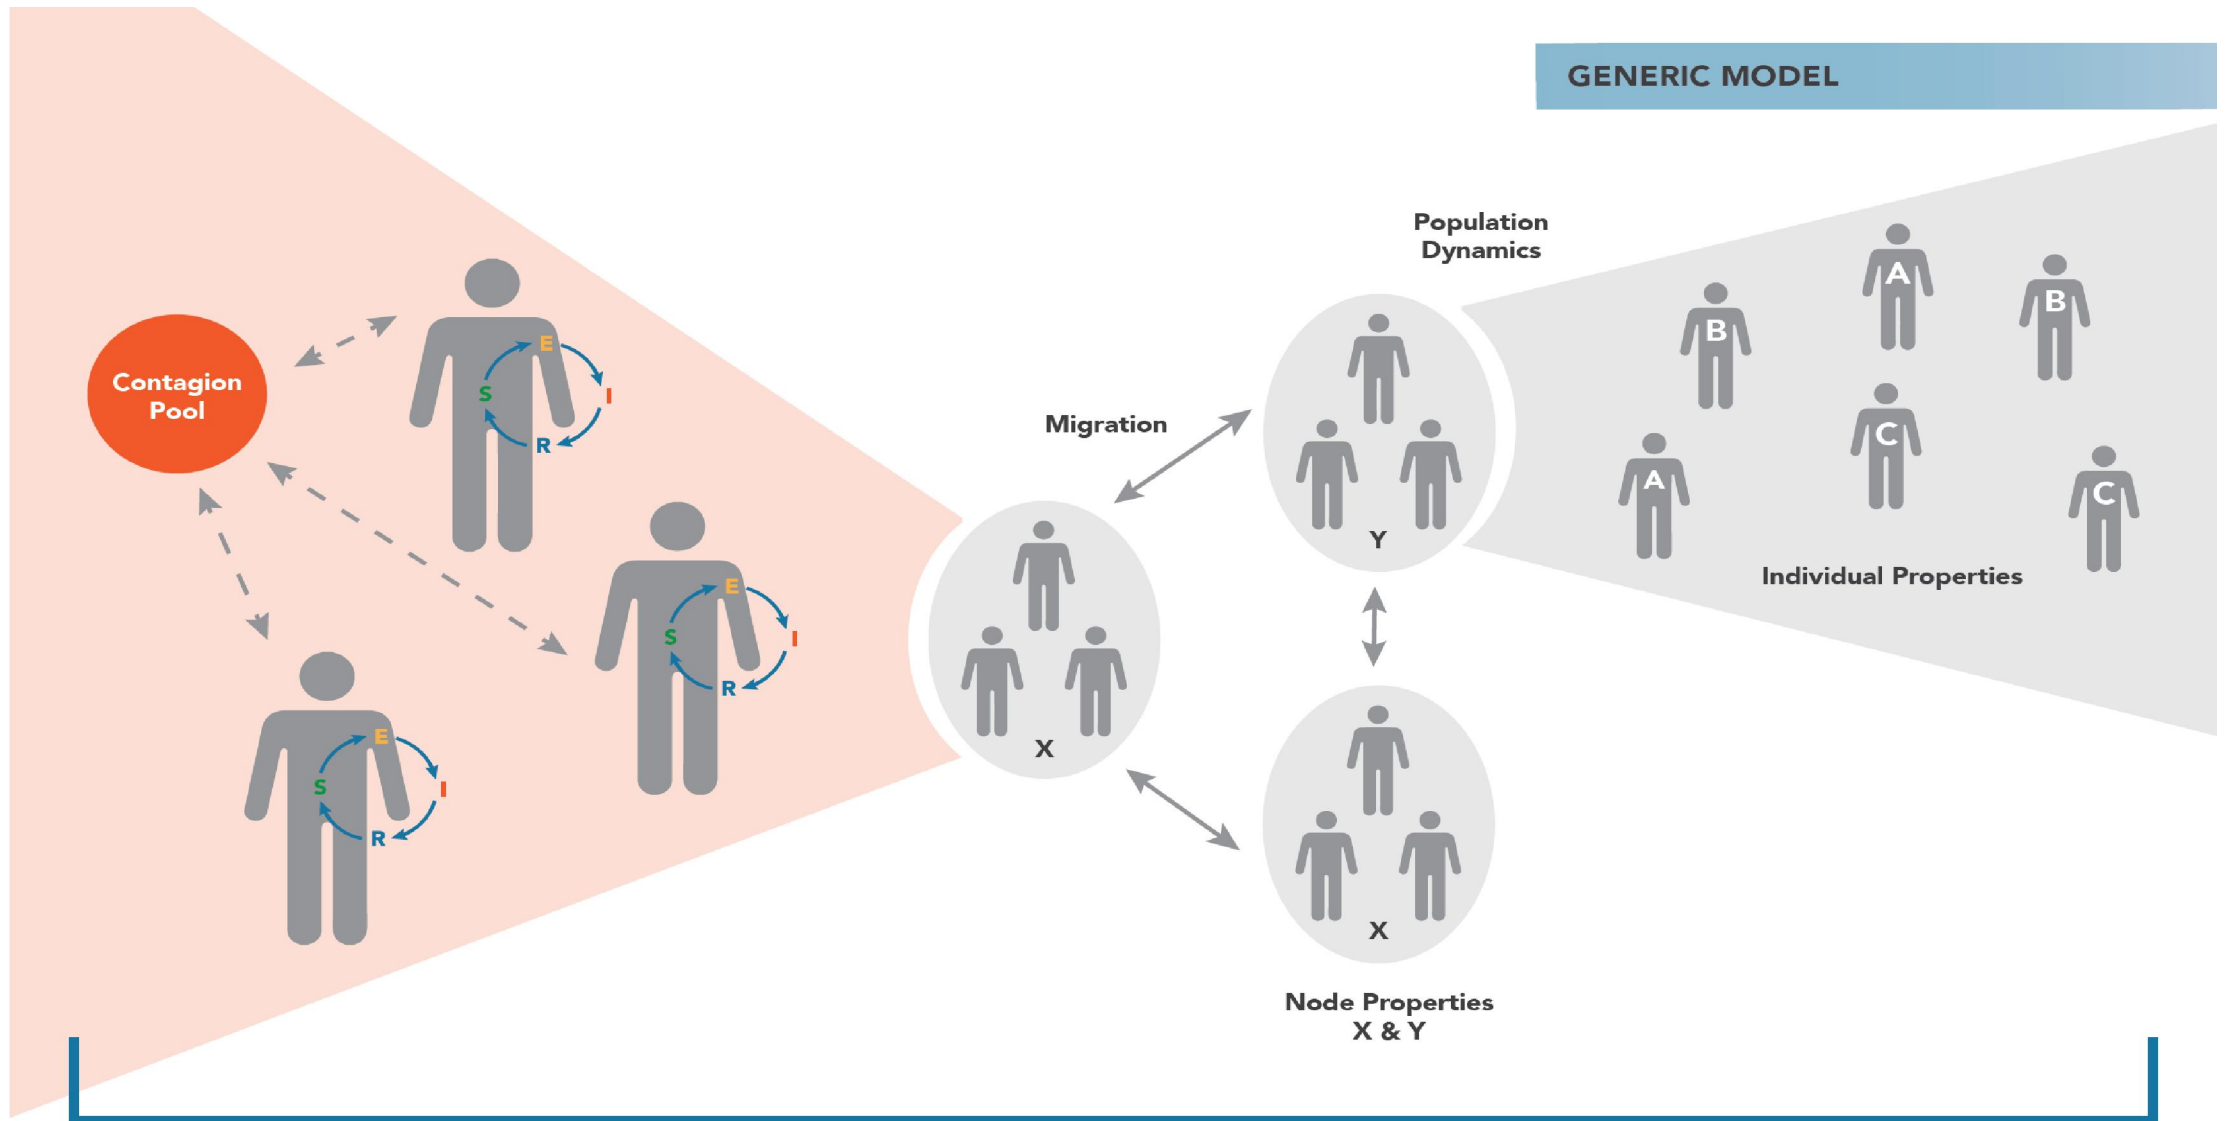

- Founded in 2007 to support Gates Foundation initiative to eradicate malaria
- Not-for-profit research group hosted within a private company, Intellectual Ventures
- Grew to ~100-person institute dedicated to quantitative analysis for global disease control and eradication

2/3 research and policy “think tank”

1/3 software “startup”

- Create professionally built and tested, re-usable tools
- Give them away for free: www.idmod.org and www.github.com/InstituteForDiseaseModeling

Overview of EMOD

Transmission Modes with Disease-Specific Features

Vector

STI

Environmental

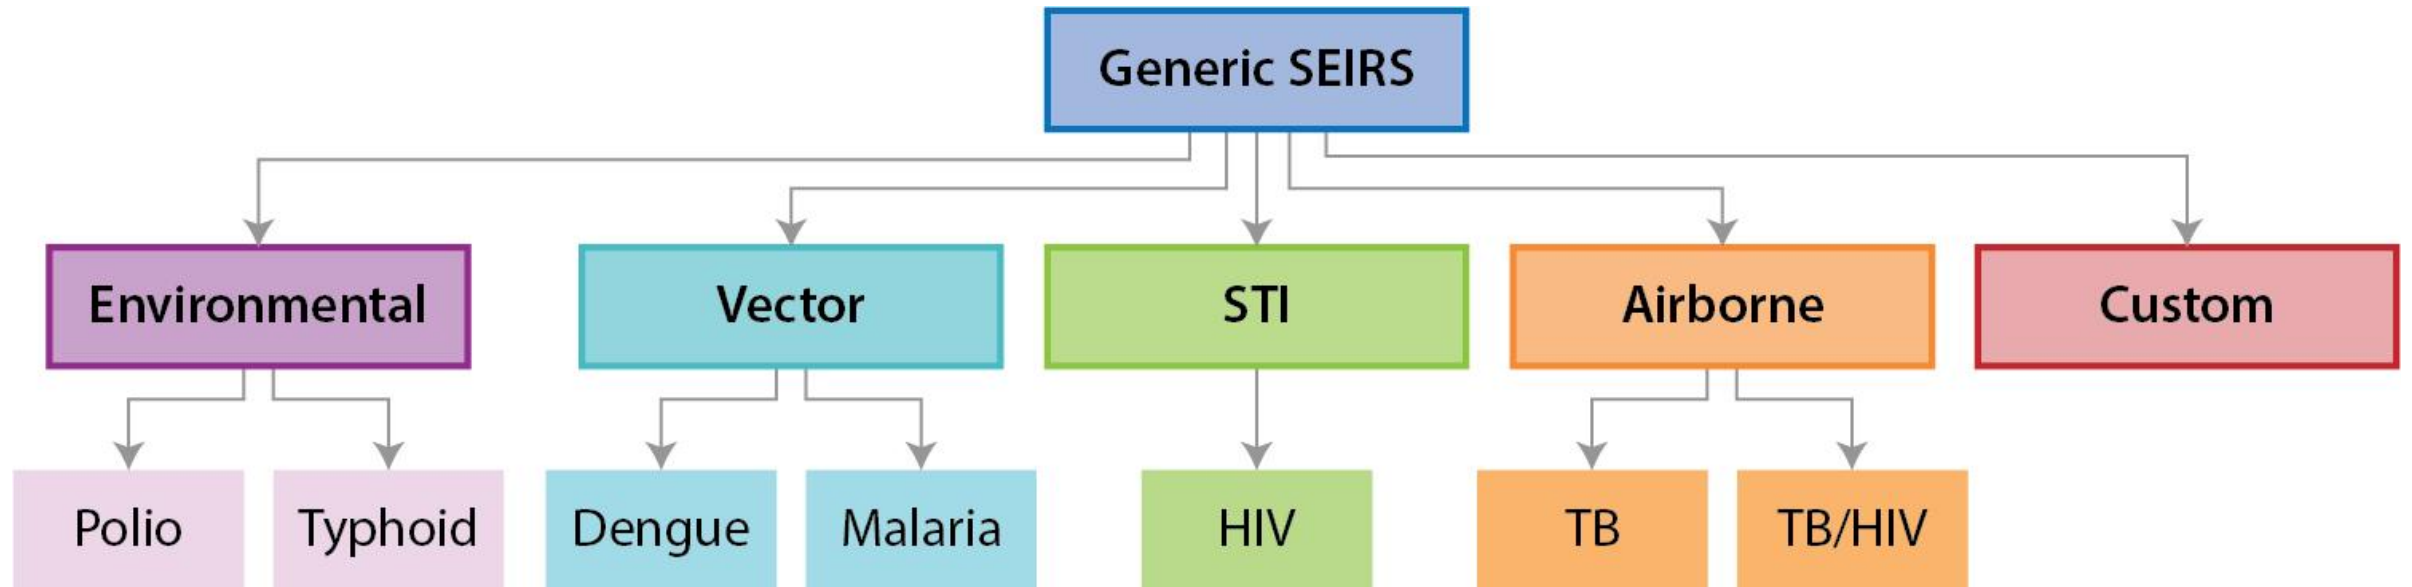

Airborne

Overview of EMOD

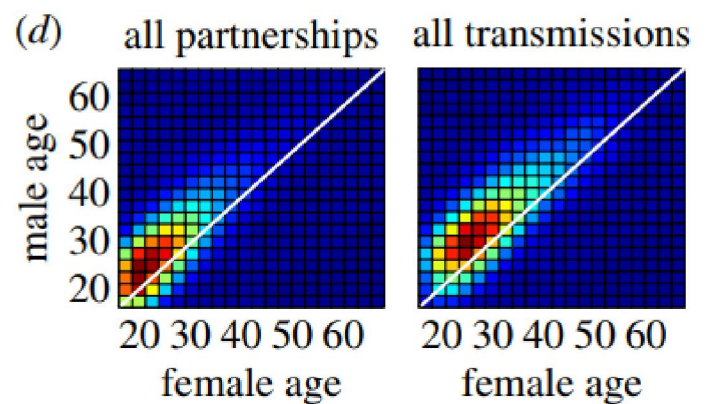

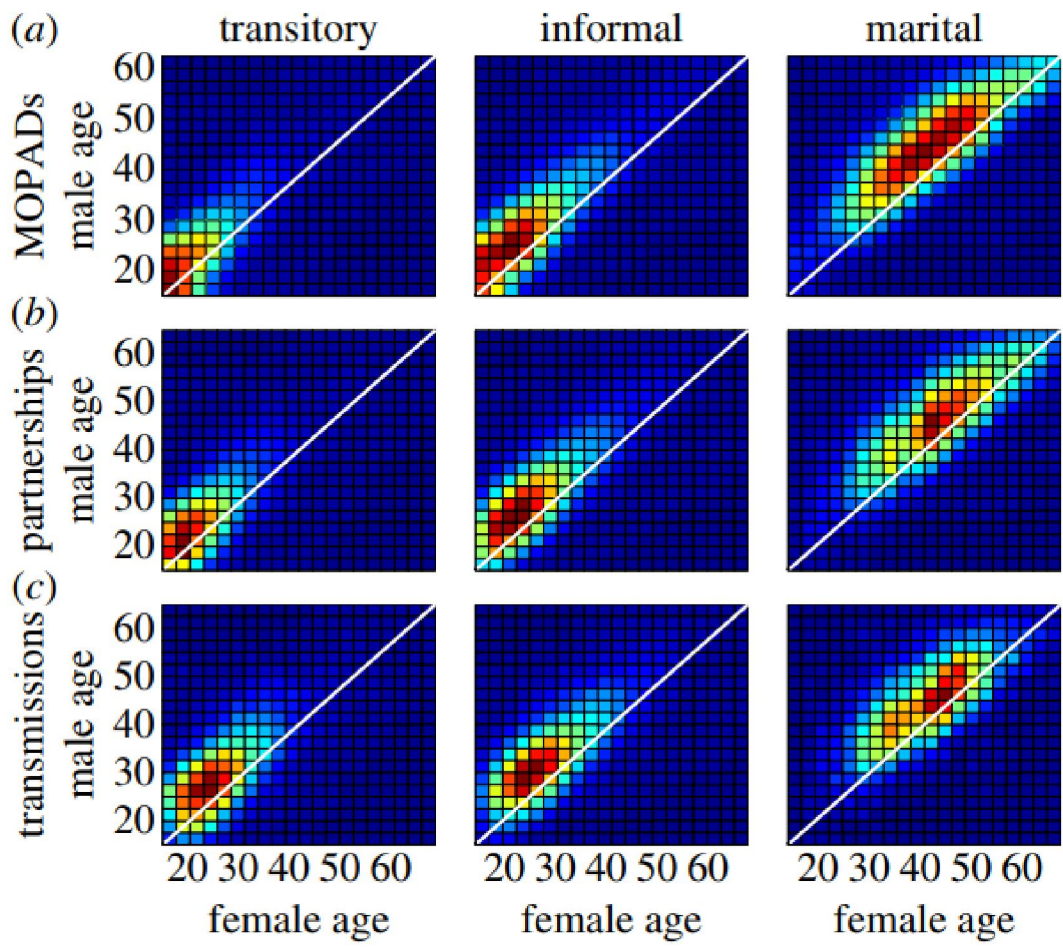

Shared across EMOD

www.github.com/InstituteForDiseaseModeling

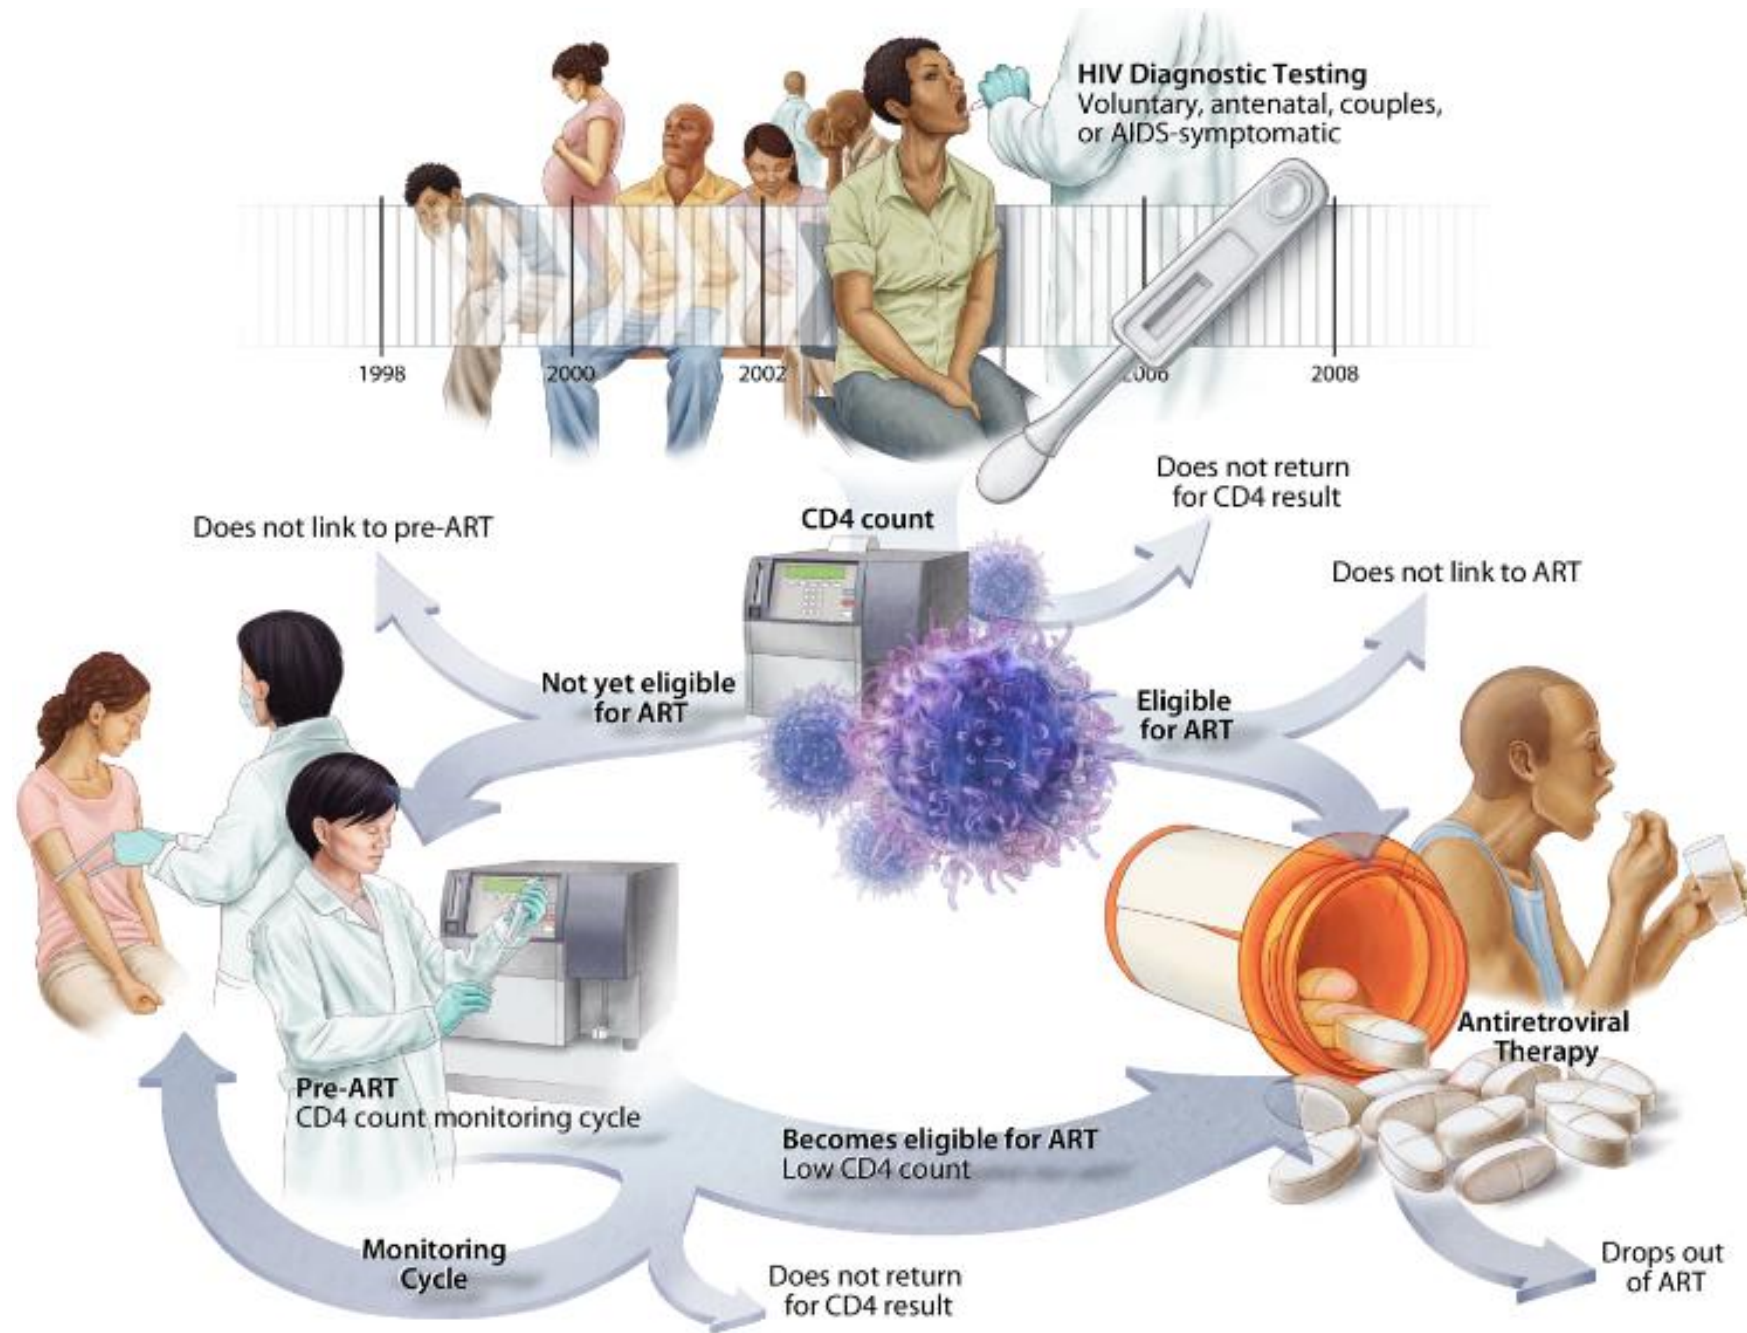

- > 600 regression tests
- > 140 scientific feature tests
 - “black box” testing
 - E.g. Kolmogorov-Smirnov test of a statistical distribution after random perturbation
- > 40 component tests
 - a.k.a. unit tests, instantiates a subset of the code base in isolation
 - “white box” testing
 - examine software components that are not user-facing, such as unique identifiers for individuals
- Extensive online documentation
 - Tutorials www.idmod.org
 - Parameter definitions, units, and ranges

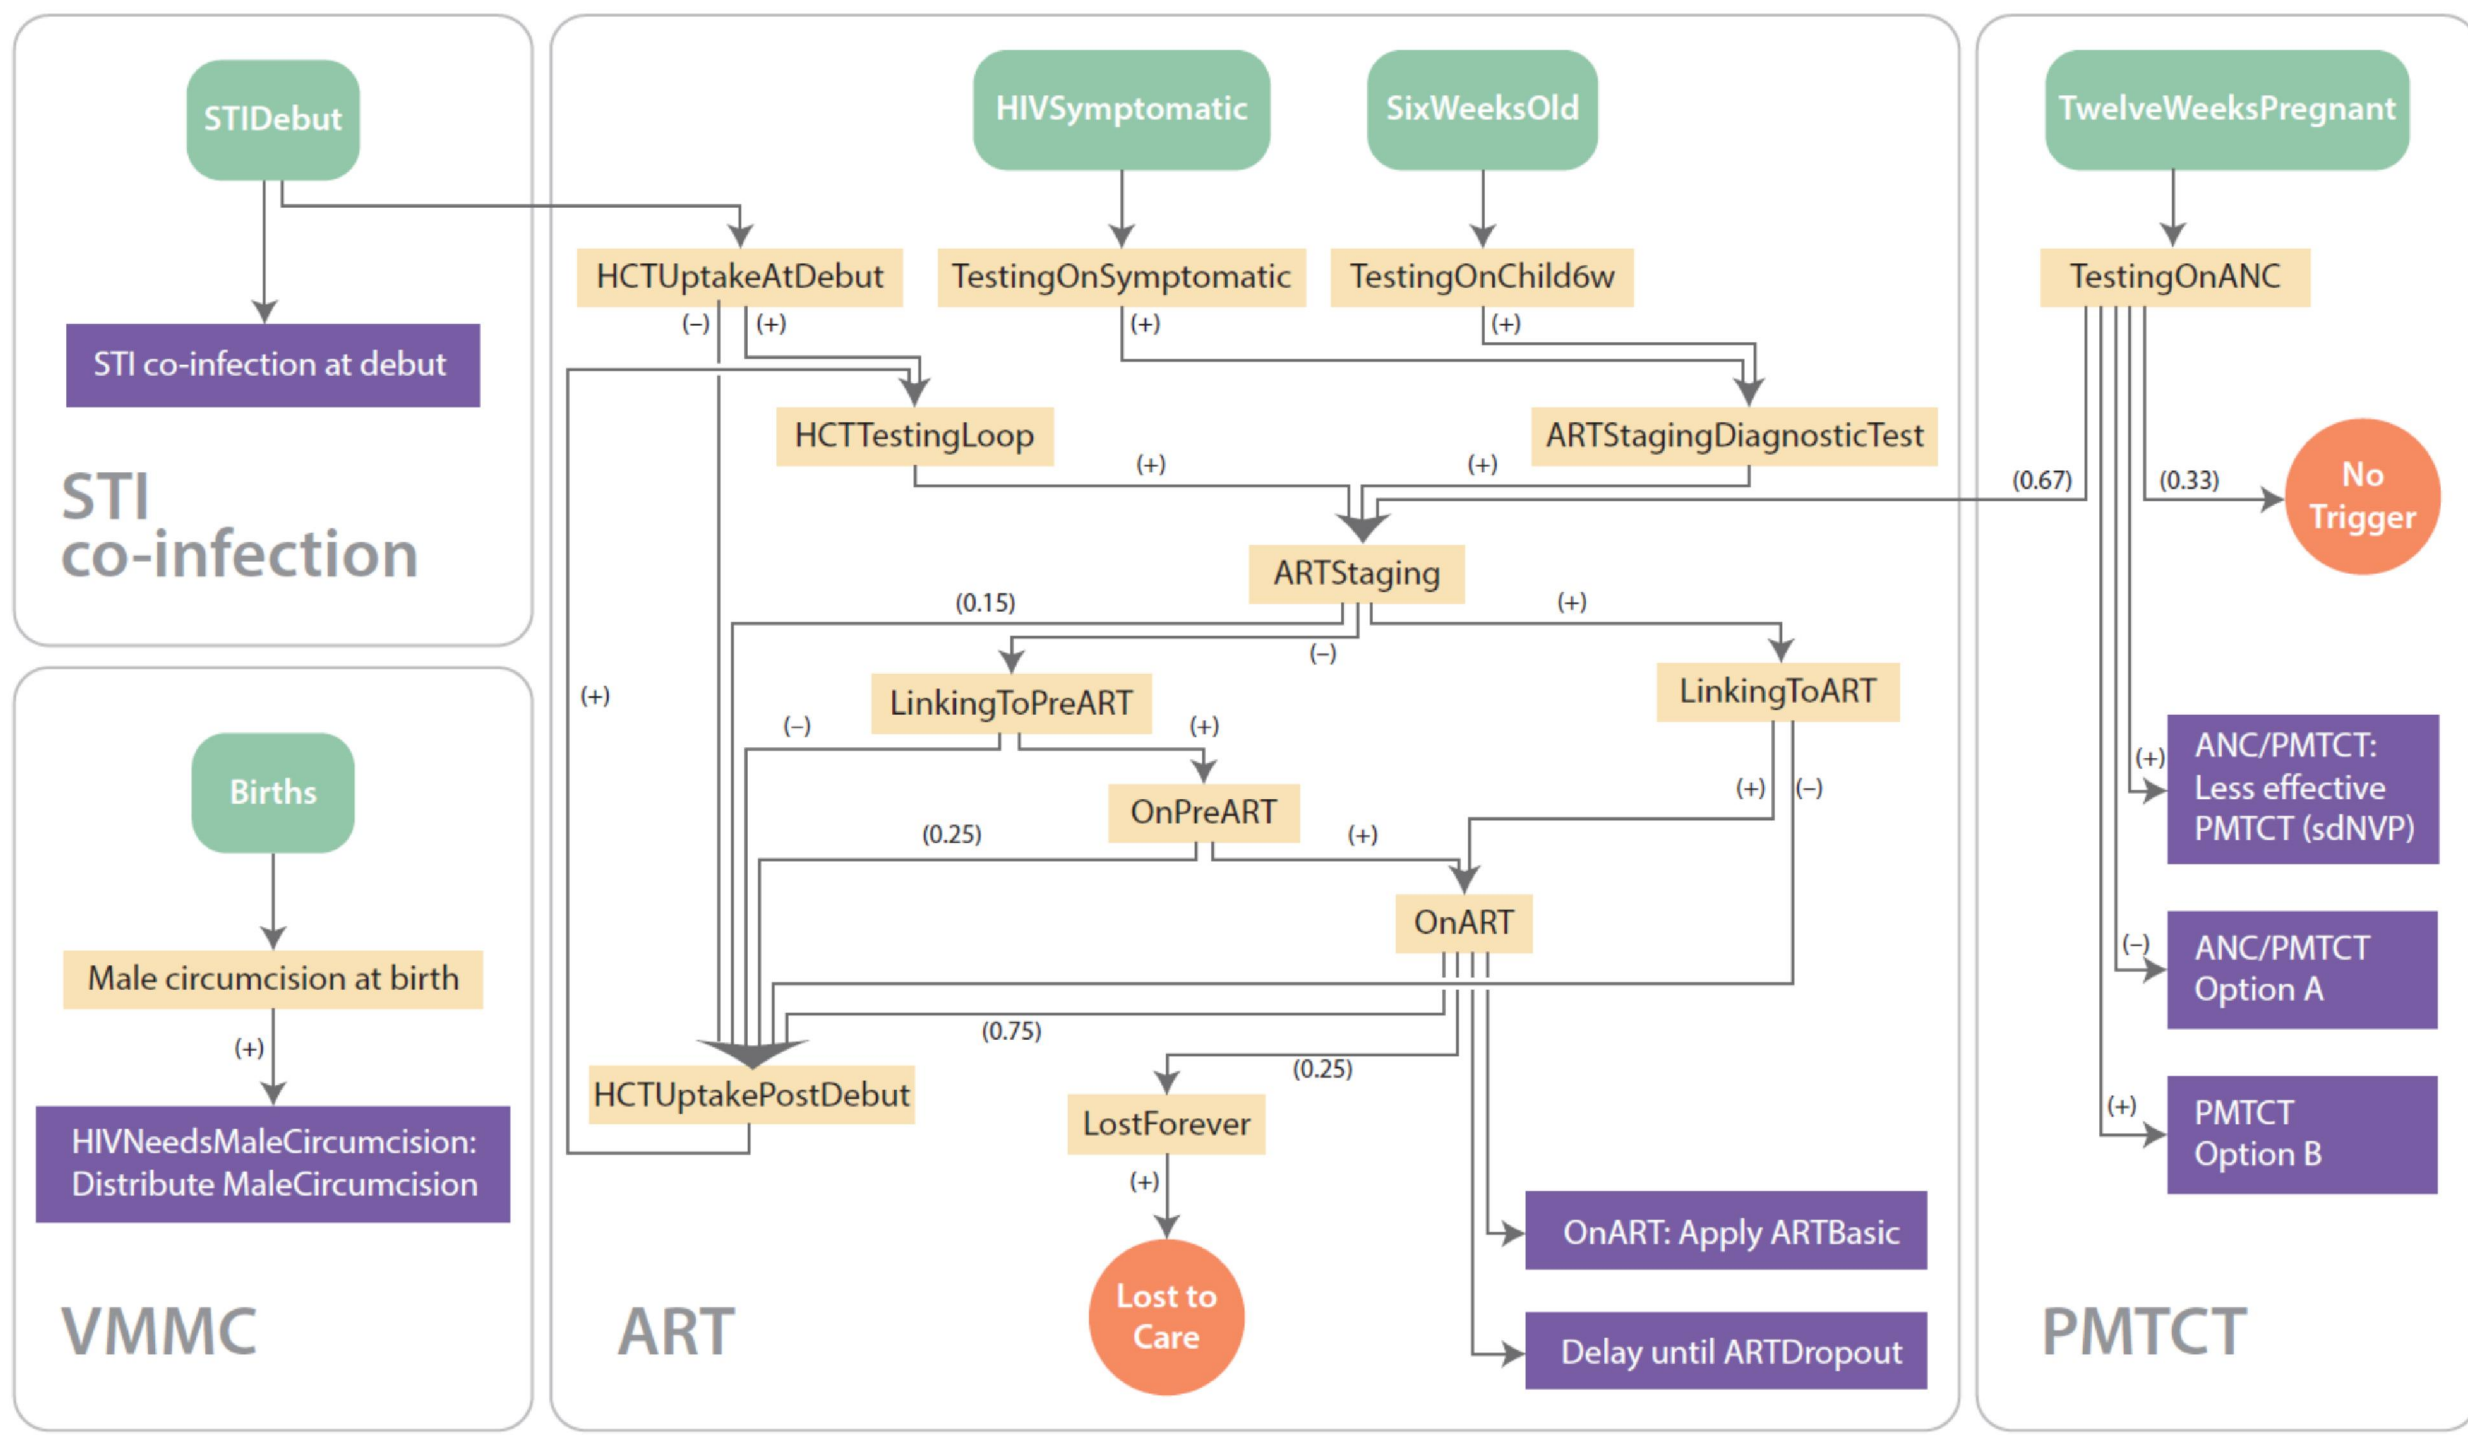

Bershteyn et al., *Pathogens and Disease*, 2018

Why

What

Example of model calibration: SA national

Conclusions

- Individual-based modeling can be used to evaluate interventions like ART, VMMC, and PrEP in the context of setting-specific transmission
- New tools and strategies will be needed to dramatically reduce HIV incidence and burden for long-term epidemic control, EMOD can be used to test the new tools and strategies
- EMOD is a resource to the community to test hypotheses, understand broader implications of new evidence, and evaluate intervention strategies
